| 1. | Which is an example of a classification task? | 1 point |
|----|--|---------|
| | Based on the size of each tumor, determine if each tumor is malignant (cancerous) or not. | |
| | O Based on a patient's blood pressure, determine how much blood pressure medication (a dosage measured in milligrams) the patient should be prescribed. | |
| | O Based on a patient's age and blood pressure, determine how much blood pressure medication (measured in milligrams) the patient should be prescribed. | |
| 2. | Recall the sigmoid function is $g(z)=rac{1}{1+e^{-z}}$ | 1 point |
| | If z is a large positive number, then: | |
| | lacktriangledown g(z) is near one (1) | |
| | igcirc $g(z)$ is near negative one (-1) | |
| | igcirc $g(z)$ will be near zero (0) | |
| | igcomes g(z) will be near 0.5 | |
| 3. | A cat photo classification model predicts 1 if it's a cat, and 0 if it's not a cat. For a particular photograph, the logistic regression model outputs $g(z)$ (a number between 0 and 1). Which of these would be a reasonable | 1 point |
| | criteria to decide whether to predict if it's a cat? | |
| | Predict it is a cat if g(z) >= 0.5 | |
| | | |
| | O Predict it is a cat if g(z) < 0.5 | |
| | Predict it is a cat if g(z) = 0.5 | |
| | | |
| | Predict it is a cat if g(z) = 0.5 | |
| | Predict it is a cat if g(z) = 0.5 | 1 point |
| 4. | Predict it is a cat if g(z) = 0.5 | 1 point |
| 4. | Predict it is a cat if $g(z) = 0.5$ Predict it is a cat if $g(z) < 0.7$ True/False? No matter what features you use (including if you use polynomial features), the decision boundary | 1 point |
| 4. | Predict it is a cat if g(z) = 0.5 Predict it is a cat if g(z) < 0.7 True/False? No matter what features you use (including if you use polynomial features), the decision boundary learned by logistic regression will be a linear decision boundary. | 1 point |
